# EAB and its early detection: New methods offer new options

J. Fidgen & K. Ryall  
Canadian Forest Service  
Great Lakes Forestry Centre

Natural Resources  
Canada

Ressources naturelles  
Canada

Canada

- Visual surveys
- Trapping
- Branch sampling
- Application of branch sampling

# Symptoms

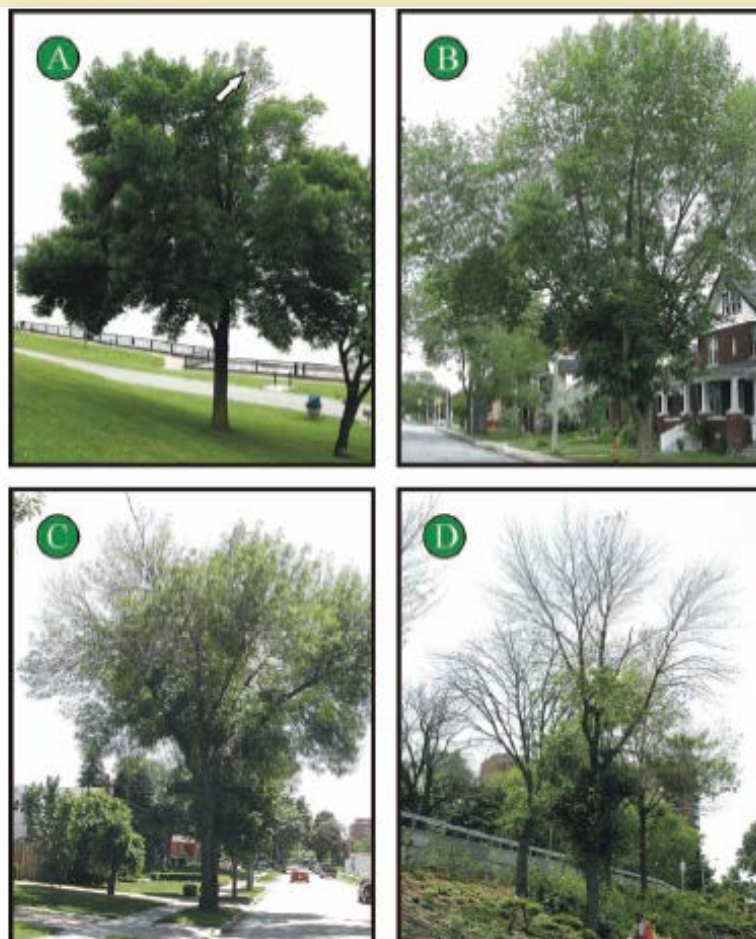

Fig. 14. Progressive degrees of thinning and chlorosis in crowns of urban ash trees resulting from EAB attack: A) flagging, B) thinning of crown, C) branch dieback, and D) dead branches.

Fig. 15. Epicormic shoots on the boles of ash trees; A) and B) newly sprouted shoots on woodlot trees, C) at the base of the bole on a plantation-grown tree, and D) on the bole and roots of a suburban tree.

# Woodpecker

# Galleries/ Exit Holes

Fig. 19. The serpentine larval galleries of EAB exposed by peeling back the bark of the host tree: A) early stage gallery, B) complete gallery with larva entering pupal chamber, C) many distinct galleries under bark, and D) intermingled galleries under bark of severely infested tree.

# Bark Windows

- Assists in detection of trees of concern
- Quick procedure
- Allows for wide-scale detection surveys
- Relatively poor tool for use on 'healthy-looking' trees

## Challenges with EAB survey

- ✦ While visual surveys are relatively straightforward... It is difficult to detect new infestations until it is too late:
  - Often present for several years
  - Heavily-infested trees
- ✦ **Need** to develop sampling methods for early detection & monitoring
  - Find populations earlier
  - Buys more time and widens management & control options

# Ground-based surveys – Asymptomatic trees

# Trapping

- Single prism traps hung in ash trees are commonly used in US and Canada
- The baits used vary with color and design of trap, placed in top centre of trap
- Large steel hooks are used to attach trap to tree,
- Traps are checked 1 or more times throughout season (June-Aug) for presence of EAB
- Process of servicing traps and cleaning samples is messy

# Purple Prism Traps

- Used in the USA
- Baited with Manuka/ Pheobe oil (smell of bark and wood)
- Double-deckers\* also use green leaf volatiles (Z-3 hexenol or GLV)
- Traps placed in open (DD) or low in tree near bole

# Green Prism Traps

- ✧ Use GLV (CFIA surveys)
- ✧ May also use lactone (EAB pheromone)
- ✧ Upper canopy, exposed to direct sunlight, where EAB adults are mostly like to be flying and feeding

Joshua Plunkett, MinnDA

- ✧ Adding a 3 mg 3Z-lactone lure significantly improves capture rate and proportion of locations positive for EAB

# Lindgren Funnel Traps

- Placed at varying heights in tree
- Baited with Manuka/ Pheobe oil or GLV
- Not commonly used for monitoring
- However, used for dissemination of fungal pathogens into populations of EAB (Lyons et al. 2012)

# Trap Trees

- Trees are girdled to induce stress and attract EAB
- Trees examined for signs and symptoms of EAB
- Then, they are peeled to reveal larval galleries
- Sticky traps can also be deployed; EAB as well as potential natural enemy wasps can be surveyed
- Not practical for widespread use...

# Branch Peeling

Natural Resources  
Canada

Ressources naturelles  
Canada

Canada

## Sampled trees in:

- Toronto
- Pickering
- Oakville
- Sault Ste Marie
- Most with NO signs of EAB

- ✧ Infestation begins in the **crown** of ash trees, on suitable branches
- ✧ Supporting evidence:
  - Within-tree distribution of bronze birch borer and two-lined chestnut borer
  - Preferences by EAB for diameter and bark thickness

- ✧ Sampled 48 infested trees showing no signs or symptoms of emerald ash borer attack

Method	# infested trees detected	Accuracy
Visual inspection	0 of 48	0
Bole window	11 of 47	23
Crown sampling	45 of 48	94

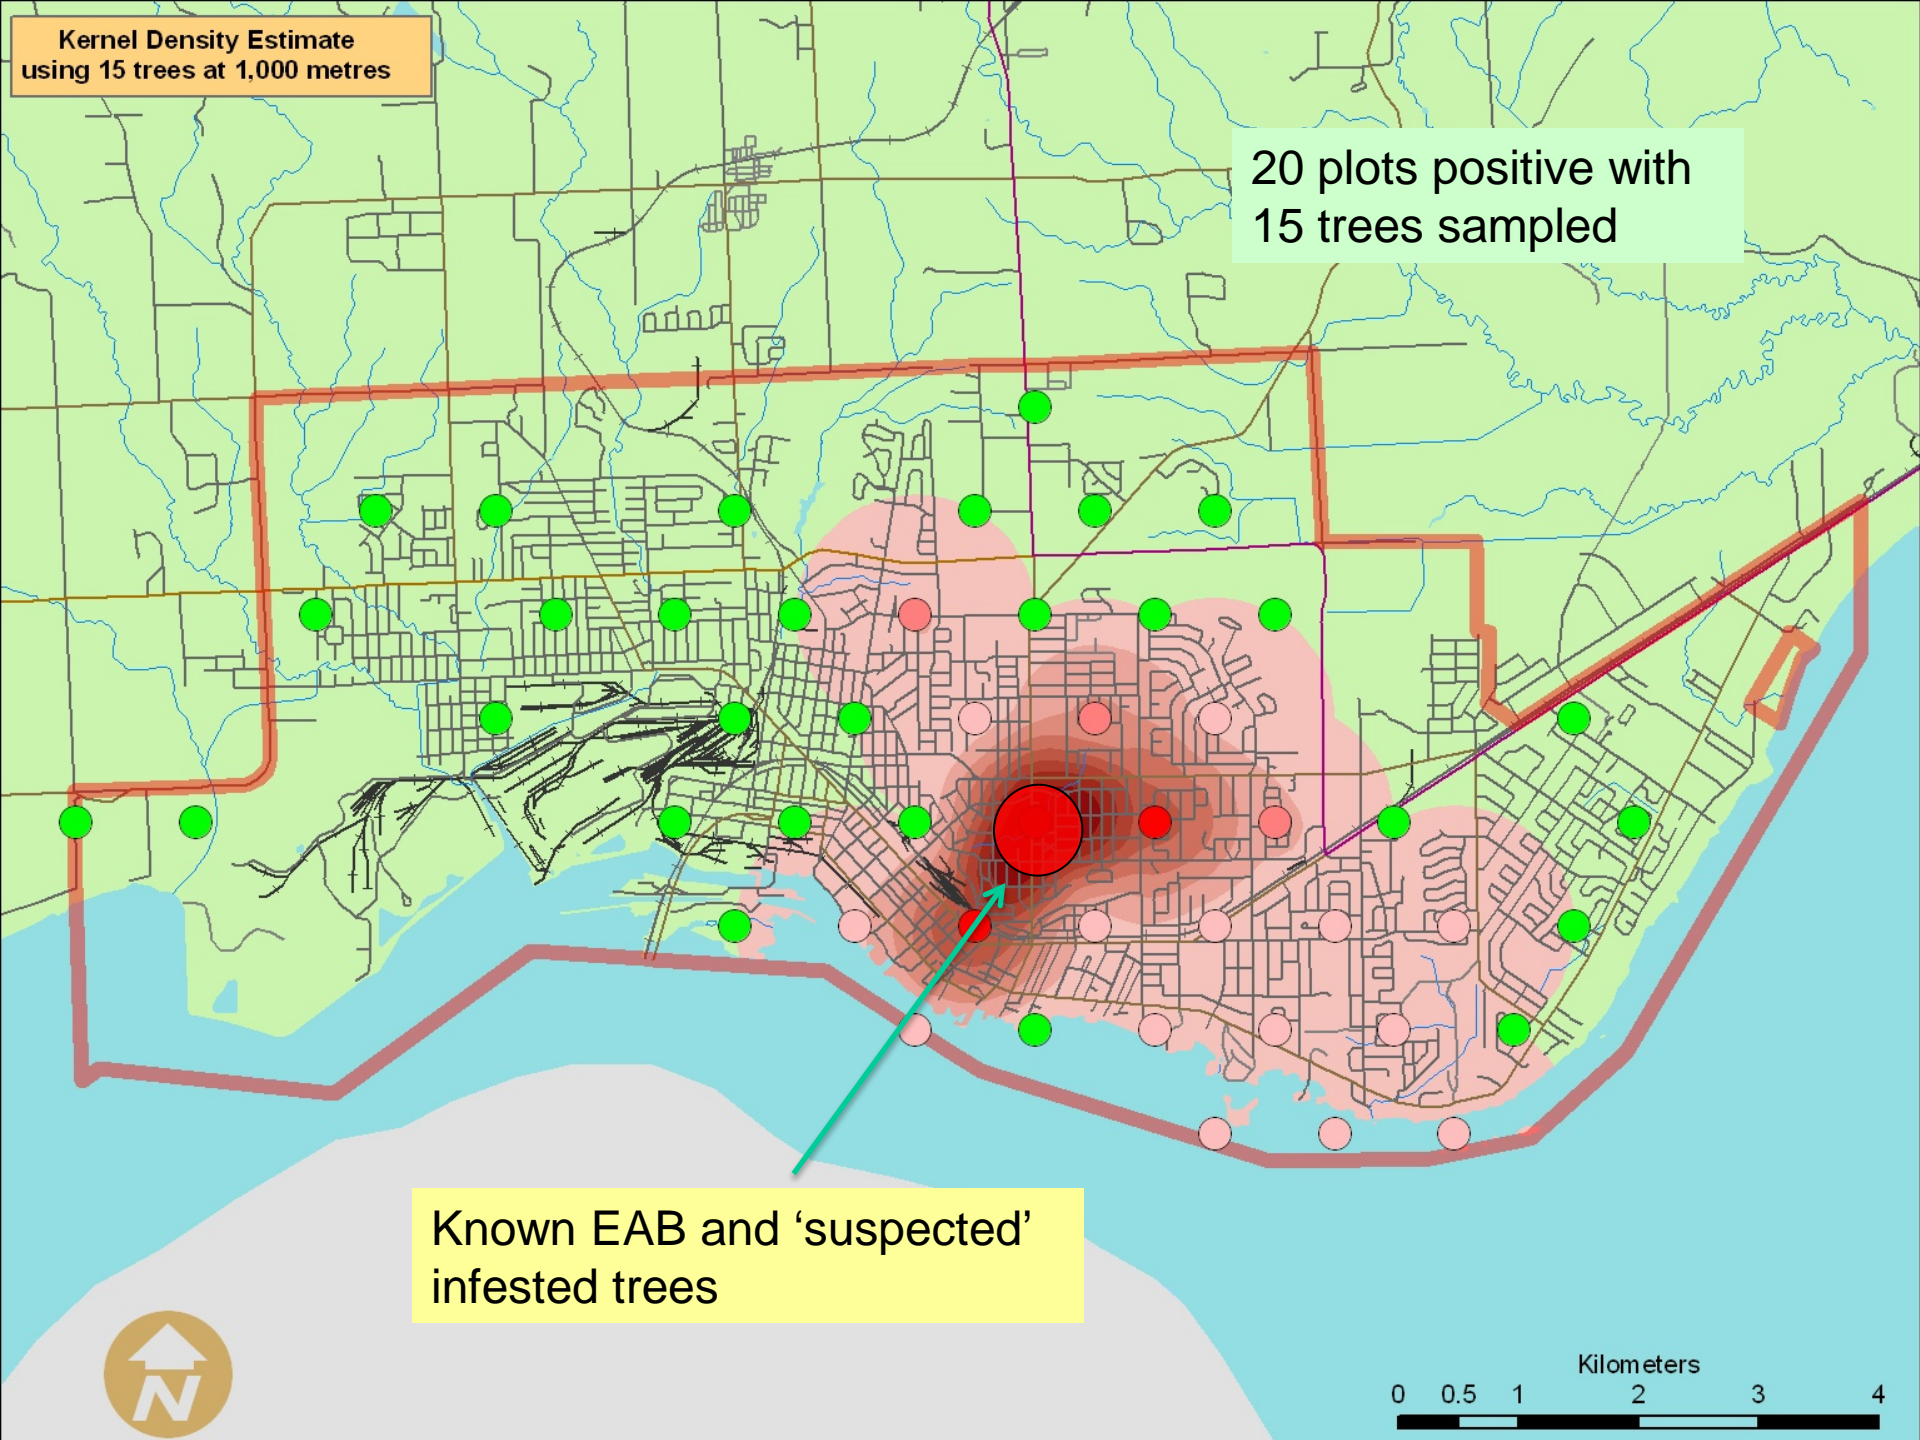

# Deploying Branch Sampling

- ✧ Used grid sampling, 1-km spacing
- ✧ Sampled 5 suitable ash trees (street trees)
  - Quantified EAB gallery density
  - SSM and Oakville examples

Kernel Density Estimate  
using 15 trees at 1,000 metres

20 plots positive with  
15 trees sampled

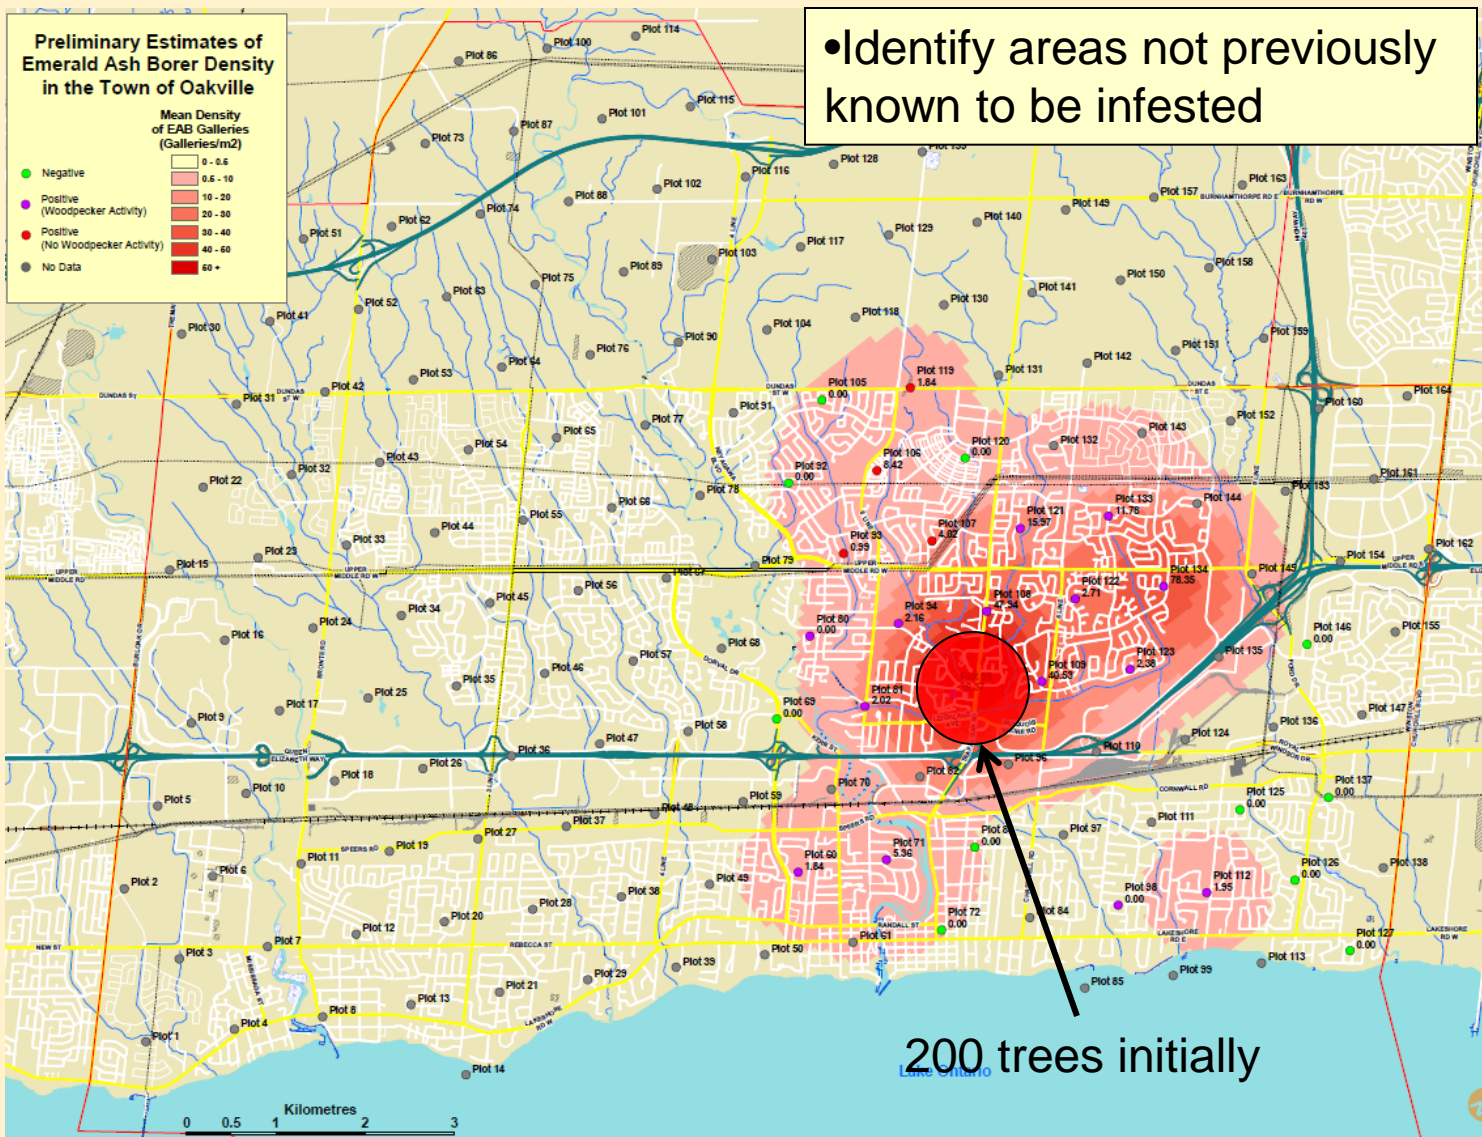

Known EAB and 'suspected'  
infested trees

# Town of Oakville

# Peeling Procedure

## Detectability of the Emerald Ash Borer (Coleoptera: Buprestidae) in Asymptomatic Urban Trees By Using Branch Samples

KRISTA L. RYALL,<sup>1</sup> JEFFREY G. FIDGEN, AND JEAN J. TURGEON

Canadian Forest Service, Great Lakes Forestry Centre, 1219 Queen Street East, Sault Ste. Marie, ON, Canada P6A 2E5

Environ. Entomol. 40(3): 679–688 (2011); DOI: 10.1603/EN10310

- ✧ Branch sampling method
  - Open-grown urban street trees
  - Remove 2 branches from mid-crown
  - ‘Whittle’ bark from basal 50 cm of a 75 cm long branch piece
  - 75% probability of detection
  - Detects low-density EAB infestation
  - Can be carried out with yearly pruning operations in fall

- ✧ Best for open grown trees
  - 20-40 cm DBH
  - 5-15 cm diameter branches
  - South & west aspect preferable
  - Sample top portion of branch first
- ✧ Less applicable for:
  - Smaller (<20 cm DBH) or woodlot / closed canopy trees  
(Branches may be too small)
- ✧ Detection rate lower at very low EAB density, 55%

## Time / Costs

# Trees / plot	Minutes/ tree
5	48
10	31

- ✦ Supply costs: \$200-3000
  - ✦ knives, drawblades, vices, bucket trucks, etc
- ✦ Our estimate: 35 minutes / tree for complete whittling
- ✦ Crew of two: minimum 100-120 trees per work-week
- ✦ More efficient to sample more trees per plot (?)
- ✦ 13-19 minutes for first detection
  - ✦ Stop whittling after first detection to save time (?)

## Detection survey research (Legg et al.)

- ✧ Model output:
  - # trees to sample for various probabilities of detection
  - \*Stop sampling when first infested tree is found
- ✧ RANDOM selection of trees for sampling
- ✧ Tested in several municipalities

5,000 Tree Population				
Infestation	0.50%	1%	2%	4%
Prob>X	5K	5K	5K	5K
60	180	100	45	25
70	230	130	45	30
80	320	165	80	40
90	450	230	120	60
95	>500	305	150	80
99	>600	460	250	120

Sample up to 150 trees for 95% probability of detecting of infestation, or 3% of total number of trees
